

Customized stationary scissor lift for factory cargo lifting

What' s the stationary scissor lift:

stationary scissor lift is a cargo lifting equipment with good lifting stability and wide application range. It is composed of platform, scissor structure, hydraulic system and control system. The platform is made of steel plate with pattern to anti skid. Scissor structure is made of steel tubes, tube size and thickness depends on load capacity, length and layers depends on lifting height. Hydraulic system composed of oil cylinder, oil tube and pump station. Control system composed of control box, button, sometimes remote. Other accessories like platform fence, scissor structure cover and lifting rails are also available.

stationary scissor lift is 100% customized equipment, basic parameter such as platform size, lifting height and load capacity, other specifics like voltage, color, lift body cover and etc. Stationary scissor lift uses steel frame structure or a high-strength steel plate structure with a load capacity ranging from 0.3 to 100 tons, and the lifting height is generally 1-10 meters. If the lifting height is above 10 meters, it is recommended to use a rail lift, because higher lifting height requires more layers scissor structure, it will make the lift self height very tall, not easy to load and unload cargo.

stationary scissor lift features:

The first feature of stationary scissor lift is it's high customization, size of the table, load capacity, lifting height, etc. All according to customer's requests. Especially the load, scissor structure can make very big load capacity.

It's pre-assembled in our factory before delivery, customer don't need special teams to install and do test and commissioning, only need to put it in the pit and connect to power supply then it will work.

The structure of stationary scissor lift is very simple, so it is very easy to operate and maintain. Meanwhile the cost will also be effective.

stationary scissor lift application:

Stationary scissor lift is a cargo lifting equipment with good lifting stability and a wide range of applications, it mostly used in industrial and mining enterprises, pharmaceutical and logistics production lines, and used for cargo transportation between the height differences of production lines; material loading and unloading; adjusting the height of workpieces during workpiece assembly; feeding materials from high-altitude feeders; lifting components during large equipment assembly; loading and unloading of large machine tools; and rapid loading and unloading of goods in storage and loading and unloading sites with

forklifts and other handling vehicles. They can be used as delivery elevators in other industries to transport goods, lift and load goods between basements and floors, and can also be used for lifting stages, car display stages, and lifting operating tables. Most are designed and customized according to customer requirements and on-site conditions.

stationary scissor lift price:

stationary scissor lift is a customized product, so the parameters are different and the price of the machine will be different. The price range of the machine is approximately between 1000 USD and 10000 USD.

For example:

Platform size is 1200*2400mm

Load is 4600kg

Lifting height is 3m

Platform thickness is 5mm

oil cylinders: 2* Φ 100

Pump station: 4KW

Price: 4500USD based on FOB Qingdao port

stationary scissor lift warranty:

1. Spare parts with the machine.
2. One-year free warranty, we undertake all charges. Apart from man-made fault.
3. Free spare parts in 3 years, but after one year customer should undertake freight cost. Apart from man-made fault.
4. Life time technical support.

How to get the quote of stationary scissor lift:

If you are interested in this product, please let me know the details as below:

Lifting height:

Platform size:

Load:

And then we will make a detailed plan for you.
